Hiring Team

Ryson International

Yorktown, VA

Dear Hiring Team,

I'm a Hampton Roads developer who builds internal business applications in React, Python, and PostgreSQL — and I'm genuinely interested in writing software that runs on a production floor. Ryson's Junior Application Developer role is exactly the kind of position I've been looking for: local, hands-on, and focused on tools that matter to the people using them.

My recent production work includes AdvisoryCloud 3.0 — a SaaS platform built in React 18 with Supabase/PostgreSQL, real-time messaging, role-based access, and 15+ database tables with Row Level Security policies, taken from requirements to live production in seven days. I also built a Container Tracker for a logistics client — a React/Supabase application with a six-stage container status pipeline, live shipping API integration, full CRUD persistence, and a fleet-wide analytics dashboard, deployed with real operational data. In both cases I owned the full stack: schema design, backend logic, API integration, and UI. At Catalyzt Nutrition, I built an internal application infrastructure from scratch — linked database architecture, role-based interfaces, automated workflow logic, and client-facing forms — all deployed to production and used daily. I implemented custom JavaScript via Airtable Scripting Extension for batch processing and data integrity logic, and integrated internal systems with third-party tools via APIs and automation triggers.

Earlier at Ferguson Enterprises, I built MS Azure and MS SQL Server data pipelines for large-scale ecommerce operations and managed EDI integrations — including the mapping, FTP/SFTP/AS2 connection management, and XML processing for vendor onboarding. That breadth of data integration experience translates directly to the kind of internal tooling and systems connectivity work a manufacturing environment requires.

I use Claude Code and Cursor daily for development acceleration and review all AI-generated output before it goes anywhere near production. I understand when and why AI tools get things wrong, and I hold my output to the same standard regardless of how it was generated. I'm local, I'm available, and I'd be glad to come in and talk about what you're building. Thank you for your consideration.

Sincerely,
Alexander Tobin
